Senior Software Engineer – Frontend-Focused Full-Stack (Remote) | Hypori

Cover letter

What drew me to Hypori is that the Console is where the privacy promise becomes an everyday job for someone. A group or tenant admin needs to know what they are changing, who it affects, and what to do if it fails. That's the kind of interface I enjoy building.

At Office Evolution, I built a front-desk Wi-Fi support tool and the provisioning behind it. Each customer office had its own VLAN, and individual Wi-Fi accounts had to land on the right network. The hard part wasn't putting a reset button on a page. It was giving receptionists enough control to solve a real problem without asking them to think like network engineers. That experience still shapes how I design administrative interfaces.

More recently, I designed the React and Next.js document workflow for ProofMark, from PDF fields and recipient routing through signing and verification. I worked across the interface, typed APIs and data so the steps and fallback paths made sense to the person using them. I've also been on the other side of that work, running NOC escalations at Front Range Internet and building diagnostics for the people who inherit a problem after it reaches production.

I like to keep the account scope and the status of an action visible at the point where an operator commits a change. I'd like to bring both perspectives to Hypori: making the Console easy to extend for the engineers who build it and easy to reason about for the people trusted to run it. I'd start by listening to the admins and support staff who know where the current workflows slow down, then trace those issues from the UI to the service before deciding what to change.
